Safety of mobile phones and other transmitting devices: what does the research say?

Dr Mary Redmayne, Department of Epidemiology and Preventive Medicine, Monash University, Melbourne, Victoria, Australia

Abstract:

Media reporting on mobile phone safety is generally either alarmist or ‘no worries’. So what is a person to believe? This talk will briefly introduce how wireless technology operates to enable informed decision-making on how to reduce exposure to these emissions, if desired. Mary will then review some research examining the effects of radiofrequency exposure on headaches, cognition, the brain’s electrical activity, and male fertility (as time allows).
