Diabetes is a condition that has become arguably the largest worldwide epidemic. In the last 10 years there have been dramatic improvements in the way we treat type 2 diabetes. This lecture will review the new ways that we are managing diabetes and emphasise the potential benefits that these new treatment strategies could yield in terms of reduced mortality and a decrease in the major burden of diabetes and its complications.

ABOUT OUR SPEAKER:

Professor Mark Cooper AO is inaugural Head of the newly established Department of Diabetes at Central Clinical School (CCS). Prof Cooper is a senior endocrinologist with an active clinical practice at the Alfred in addition to his substantial research activity. His research interests are in diabetes and its three major complications: kidney disease, heart disease and blindness.
