

Did you know that Mammograms can also diagnose Heart Disease?

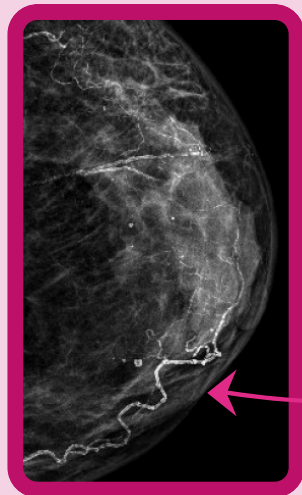

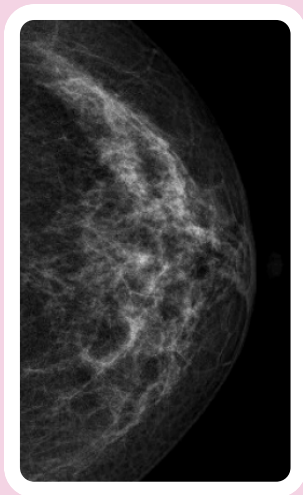

One Scan: Two Diseases.

Heart disease and Breast Cancer are leading causes of illness and death among Australian women, but only Breast Cancer is routinely screened for. To bridge this gap, we've launched the **TIMTAM Study**, which explores whether calcification in breast arteries, visible on routine mammograms, may help identify women at risk of Heart Disease.

25% of women have this finding on their mammogram, which can help identify women at risk of Heart Disease:

Normal mammogram

With breast arterial calcification

See how your next mammogram can also help assess your risk for Heart Disease.
